

Objectives

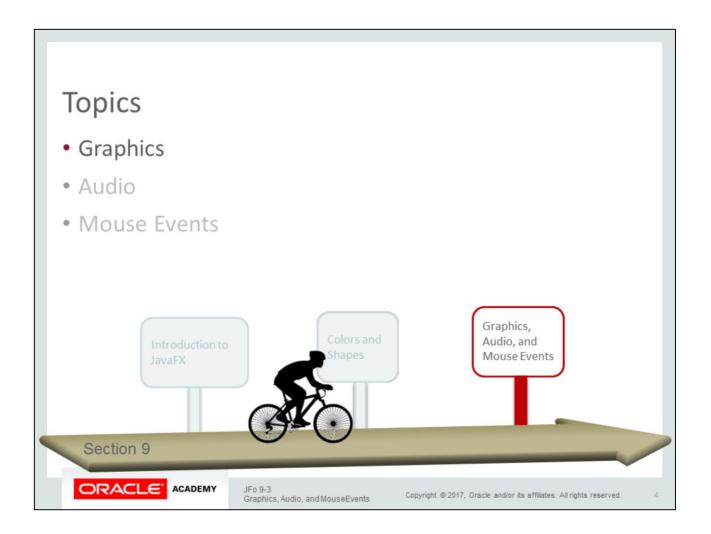

This lesson covers the following objectives:

- Create and use a JavaFX image and ImageView
- Create and use JavaFX audio
- Create and use MouseEvents
- Understand Lambda expressions in GUI applications

JFo 9-3 Graphics, Audio, and MouseEvents

Using Your Own Graphics

- JavaFX can provide UI elements, shapes, and text.
 - But if you have a talent for art, you can use your own graphics in place of those that JavaFX provides.
- For example:

- The art for the level-select button wasn't created by JavaFX.
- But we used JavaFX to procedurally add level numbers, text, and the graphic of Duke.

JFo 9-3 Graphics, Audio, and MouseEvents

A JavaFX Image and ImageView

• An **Image** is an object that describes the location of a graphics file (.png, .jpg, .gif ...).

```
Image image;
String imagePath = "Images/Fan1.png";
image = new Image(getClass().getResource(imagePath).toString);
```

- An ImageView is the actual Node.
 - Calling its constructor requires an Image argument.

```
ImageView imageView = new ImageView(image);
```

 An ImageView also contains the same properties as any other node: x-position, y-position, width, height ...

JFo 9-3 Graphics, Audio, and MouseEvents

Copyright @ 2017, Oracle and/or its affiliates. All rights reserved.

You'll also need to import javafx.scene.image.Image and javafx.scene.image.ImageView.

Why Have Both an Image and ImageView?

- One big advantage is animation.
 - Images can be swapped in and out of the same ImageView.
- The Fan in Java Puzzle Ball takes advantage of this.
 - The fan cycles through 2 images when it's blowing.

- Custom buttons also benefit.
 - You could use different images for buttons depending on their state:
 - Is the mouse hovering over the button?
 - Is the user clicking the button?

JFo 9-3 Graphics, Audio, and MouseEvents

ImageView Hints

How to create Images:

```
Image image1= new Image(getClass().getResource("Images/fan1.png").toString());
Image image2= new Image(getClass().getResource("Images/fan2.png").toString());
```

How to create an ImageView:

```
ImageView imageView = new ImageView(image1);
```

How to swap an Image into an ImageView:

```
imageView.setImage(image2);
```

imageView retains its properties, such as positioning.

```
Remember to import
javafx.scene.image.Image; and
javafx.scene.image.ImageView;
```

JFo 9-3 Graphics, Audio, and MouseEvents

Creating Objects with Node Properties

- So far, we've written all JavaFX code in the start() method.
 - This is similar to the beginning of the course, where most code was written in the main () method.
- Object-oriented code shouldn't be written this way.
 - Instead, objects should have Node fields.
- The start() and main() methods are intended to be drivers.

JFo 9-3 Graphics, Audio, and MouseEvents

Example: The Goal Class

- Fields
 - private Image dukeImage;
 - private ImageView dukeImageView;

- Constructor
 - Takes arguments for x and y positions.
 - Assigns the image to its respective ImageView.
 - Positions dukeImageView according to the x and y arguments.

10

The objective of Basic and Inheritance Java Puzzle Ball levels is to get the ball to the goal. The goal is represented visually as Duke. There are many more fields and methods to the Goal class, and the constructor does a few more things in addition to what's described here.

Exercise 1

- Import and open the GoalTest project. Notice that ...
 - The Root Node is publically available.
 - There's a package with several graphic files.
 - The Goal class is an ordinary Java class file type.
- Write the Goal class according to the specifications on the previous slide.
 - You'll also need to add this class's ImageView to the Root Node.
- Instantiate a few Goal objects from the start() method.

JFo 9-3 Graphics, Audio, and MouseEvents

11

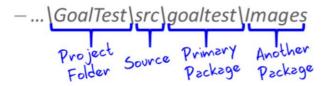

Nodes have getter and setter methods for properties like position. You can get and set the x and y positions of an ImageView just like you would with any other Node.

File Locations

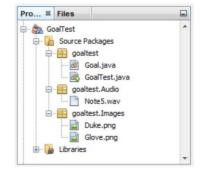

Make sure files are in the correct location.

```
Image image = new Image(getClass().getResource("Images/Duke.png"));
```

• Images/Duke.png refers to a folder within the GoalTest folder.

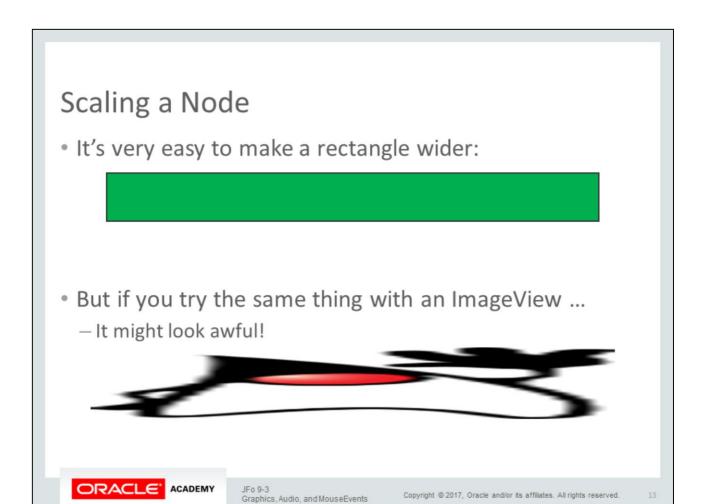

- Or a package within a package

JFo 9-3 Graphics, Audio, and MouseEvents

Scaling a Node the Right Way

- JavaFX is very good at scaling graphics.
 - The quality of the image is less likely to deteriorate
- You have the option to preserve the aspect ratio of an ImageView.
 - An ImageView's width and height scale together.
 - This avoids distortion.

```
imageView.setPreserveRatio(true);
imageView.setFitWidth(25);
```

JFo 9-3 Graphics, Audio, and MouseEvents

Ordering Nodes

- Sometimes, testers of Java Puzzle Ball didn't realize that their goal was to get the ball to Duke.
- We thought adding a baseball glove would help solve the problem.
- Duke and the glove are two separate ImageViews.
 - These needed to be ordered properly so that the glove doesn't display behind the hand.

JFo 9-3 Graphics, Audio, and MouseEvents

Ordering Nodes the Right Way

- The order that Nodes are added to the Root Node determines the order that they are displayed.
- Nodes added early are buried under nodes added later.

```
root.getChildren().addAll(gloveImageView, dukeImageView);
```

- To fix this you could ...
 - Change the order that Nodes are added to the Root Node.
 - Bring an ImageView to the front or back.

JFo 9-3 Graphics, Audio, and MouseEvents

The Goal Class

Fields

- private Image dukeImage;
- private ImageView dukeImageView;
- private Image gloveImage;
- private ImageView gloveImageView;

Constructor

- Takes arguments for \times and y positions.
- Assigns each Image to its respective ImageView.
- Positions dukeImageView according to the x and y arguments.
- Positions and scales gloveImageView relative to dukeImageView.

JFo 9-3 Graphics, Audio, and MouseEvents

Exercise 2

- Continue editing the GoalTest project.
- Write the Goal class according to the specifications on the previous slide.
 - The constructor should still take only two arguments.
 - A glove should appear on top of Duke's hand.
- Hint: Nodes, including ImageViews, have getter and setter methods for properties like position.

JFo 9-3 Graphics, Audio, and MouseEvents

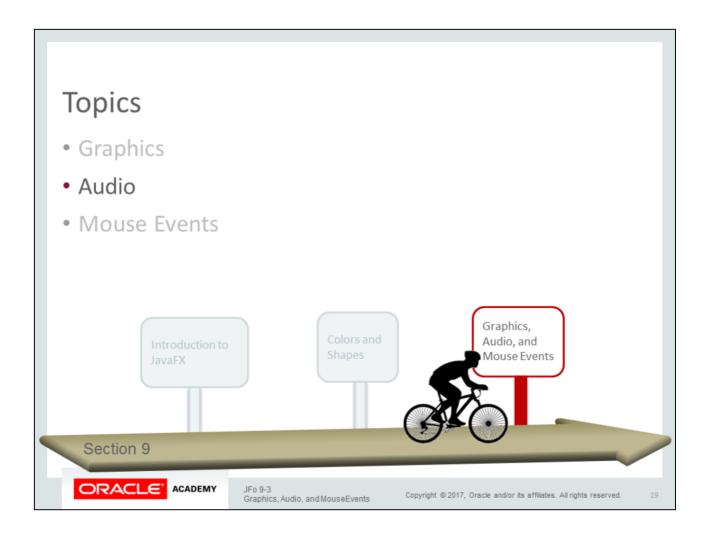

Image and Audio Similarities

Creating a JavaFX Image object ...

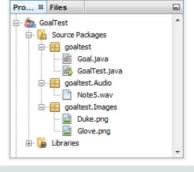

```
Image image = new Image(getClass().getResource("Images/fan1.png").toString());
```

Is very similar to creating a JavaFX Audio object.

```
Audio audio = new Audio(getClass().getResource("Audio/Note5.wav").toString());
```

It's common to store images and audio in their own

packages/folders.

JFo 9-3 Graphics, Audio, and MouseEvents

Image and Audio Differences

• An Audio object describes the location of an audio file (.wav, .mp3 ...).

```
Audio audio = new Audio(getClass().getResource("Audio/Note5.wav").toString());
```

- And unlike an Image ...
 - There is no Audio equivalent of an ImageView.
 - Audio can be played by referencing the Audio object directly.

```
audio.play();
```

- There are many other Audio methods you can call.

JFo 9-3 Graphics, Audio, and MouseEvents

The Goal Class

Fields

```
- private Image dukeImage;
- private ImageView dukeImageView;
- private Image gloveImage;
- private ImageView gloveImageView;
- private Audio tone;
```

- The Goal class contains an Audio object as a field.
 - tone plays when the mouse is pressed on Duke.
 - We'll see how to implement this feature in the next part of this lesson.

JFo 9-3 Graphics, Audio, and MouseEvents

Exercise 3

- Continue editing the GoalTest project.
- Declare an Audio object as a field.
- Instantiate the Audio object.
 - Use the .wav file in the project directory.

Remember to import javafx.scene.media.AudioClip;

JFo 9-3 Graphics, Audio, and MouseEvents

Lambda Expressions

 These methods use a special argument, called a Lambda expression:

```
imageView.setOnMousePressed( /*Lambda Expression*/ );
```

Lambda expressions use special syntax:

```
No semicolon
```

```
(MouseEvent me) -> System.out.println("Pressed")
```

 Curley braces allow Lambda expressions to contain multiple statements:

JFo 9-3 Graphics, Audio, and MouseEvents

Copyright @ 2017, Oracle and/or its affiliates. All rights reserved.

Lambdas were introduced in Java SE 8. They provide much more effective and cleaner syntax for working with GUI applications and sorting lists.

Lambda Expressions as Arguments

When these are combined, we get the following:

```
imageView.setOnMousePressed( (MouseEvent me) -> {
         System.out.println("Statement 1");
         System.out.println("Statement 2");
} );
```

- · What this code does:
 - Allows imageView to detect a mouse press at any time.
 - If that occurs, the two print statements are executed.
 - Otherwise, this code is ignored.

JFo 9-3 Graphics, Audio, and MouseEvents

MouseEvent

- A MouseEvent object exists only within the scope of the Lambda expression.
- It contains many useful properties and methods:

```
imageView.setOnMousePressed( (MouseEvent me) -> {
         System.out.println(me.getSceneX());
        System.out.println(me.getSceneY());
} );
```

- In this example:
 - -me is the MouseEvent object
 - me is accessed to print the x and y positions of the mouse cursor when imageView is pressed.

JFo 9-3 Graphics, Audio, and MouseEvents

Copyright @ 2017, Oracle and/or its affiliates. All rights reserved.

28

MouseEvent Methods • getSceneX() • getSceneY() — Returns a double. — Returns the position of the cursor within the JavaFX Scene. — The top-left corner of the Scene is position (0,0). • getScreenX() • getScreenY() — Returns a double. — Returns the position of the cursor on your computer's screen. — The top-left corner of your computer's screen is (0,0).

Graphics, Audio, and MouseEvents

There are many more methods than those listed here.

ACADEMY

ORACLE'

Event Listening

- When you write code for MouseEvents.
 - You're telling a Node to listen for a particular event.
 - But the events don't actually have to occur.
- As long as the Node is listening ...
 - It can detect any event, at any time.
- A Node can listen for many events.

```
imageView.setOnMousePressed( /*Lambda Expression*/ );
imageView.setOnMouseDragged( /*Lambda Expression*/ );
imageView.setOnMouseReleased(/*Lambda Expression*/ );
```

JFo 9-3 Graphics, Audio, and MouseEvents

Exercise 4

- Continue editing the GoalTest project.
- Complete the interactions () method so that ...
 - Duke listens for a mouse press and mouse drag.
 - Play a sound when the mouse is pressed.
 - Print the x and y positions of the mouse dragged event. This will be helpful for the problem set.
- What if interactions () is never called?
 - Comment out this method call in the constructor.

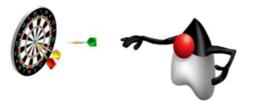

JFo 9-3 Graphics, Audio, and MouseEvents

Summary

In this lesson, you should have learned how to:

- Create and use a JavaFX image and ImageView
- Create and use JavaFX audio
- Create and use MouseEvents
- Understand Lambda expressions in GUI applications
